Dear Hiring Manager,

I am applying for **Senior Systems Test Automation Engineer / Linux Systems Validation Engineer roles in Germany**. I bring over **10 years of experience building and operating Python-based automation** for embedded Linux system validation, storage stacks, and virtualization environments, with a strong recent focus on BSP bring-up, kernel and driver stability, and LAVA Test Automation-based regression execution. I am currently learning **German (B1 level)**, and I am motivated to build my career long-term in Germany.

In my current role at **Wind River**, I validate ELXR BSP releases by owning the end-to-end build, flash, boot, and test workflow, while enforcing repeatable and auditable release gates. I design and **automate LAVA jobs using Python and Bash**, standardize log collection, and perform deep root-cause analysis to isolate kernel and driver failures, significantly reducing defect turnaround time. I collaborate closely with developers by raising high-quality Jira defects with clear reproduction steps and complete artifacts, enabling faster fixes and reliable patch verification.

I also bring **strong Linux distribution and system integration experience** that aligns well with enterprise environments in Germany. At **OpenText**, I validated SUSE and OES installation and upgrade paths, integrated RPMs into YaST workflows and repositories, and ensured dependency correctness, version consistency, and repository health. Through pre-flight validation and integration checks, I helped reduce upgrade risk and maintain predictable release behavior for customers.

Across Intel client programs, I **strengthened system-level quality in complex validation labs**. I developed automated validation for Persistent Memory (PMEM) behavior on Linux and Windows and integrated test suites into GitLab CI/CD pipelines for build gating. In virtualization environments, I created **Avocado-based regression tests for VMware ESXi and automated CI triggers** and reporting using GitHub workflows.

For Germany-based roles, I offer the combination hiring teams typically seek: strong Linux fundamentals, hands-on Python and Bash automation, disciplined defect reporting, and deep systems knowledge spanning kernels, drivers, storage, and virtualization. I am particularly motivated to **work on embedded Linux projects, including BSP validation and automotive platforms**, where reliability, traceability, and automation-driven quality are critical.

I would welcome the opportunity to discuss how I can contribute to improving regression reliability, release confidence, and defect closure speed for Linux-based embedded products in Germany.

Sincerely,

Ambati Srinivas
