Dear Hiring Manager,

I am applying for backend developer roles, with a focus in distributed-systems and event-driven platforms, in Germany where reliability, security, and scale are first-class requirements. I am currently a Software Development Engineer II at Murf AI and an IIT Kanpur graduate, with over five years of experience building production systems across AI and fintech environments.

In my current role, I design and operate distributed text-to-speech platforms that handle **50M+ daily requests** under strict latency and availability targets. I own services end to end, from architecture to production stability. I focus on cloud-native design, event-driven processing, and cost-aware scaling. These efforts reduced end-to-end latency by **35%** while sustaining **99.9% uptime** across customer-facing workloads.

Security and privacy are core to my work. I design **zero-trust architectures** for on-premises and enterprise deployments, using encrypted model artifacts, Python cythonization, **mutual TLS**, and **HMAC-based authentication** to protect proprietary AI models. I have delivered secure, air-gapped deployments for enterprise customers where model protection and compliance are non-negotiable.

In **AegisFL**, I engineered a federated learning system using TensorFlow Federated that trains across 1000+ simulated edge clients while preserving data locality. The platform achieves **96% CIFAR-10 accuracy** and aligns with **GDPR and HIPAA** requirements.

My project work reflects real-world scale and failure modes. In **FloodGate**, I built a **multi-tenant** rate-limiting gateway that sustains 50K+ requests per second with millisecond-level latency. In **StreamPulse**, I delivered real-time anomaly detection pipelines with **sub-200 millisecond inference latency**, supported by production-grade monitoring and alerting.

I am motivated to work in Germany's engineering-driven environment, where system correctness, data protection, and long-term maintainability matter. I bring strong ownership, clear communication, and practical system design experience. I would welcome the opportunity to contribute to teams building secure, scalable platforms with real user impact.

Sincerely,

Ankan Das
