Dear Hiring Manager,

I am applying for Senior software developer roles in Germany, focused on Java, Spring Boot, and cloud-native microservices. Over 13+ years, I have delivered backend systems where reliability, security, and operational clarity matter across enterprise e-commerce, identity platforms, BFSI workflows, and insurance data pipelines. I bring hands-on ownership from solution design through release execution and long-term production stability.

At Coforge, on the Walmart LTL carriers program, I owned end-to-end pickup workflow APIs supporting availability checks, scheduling, rescheduling, and cancellations across multiple carrier integrations. I built Spring Boot microservices using Java 8, 11, 17, and 21, integrating Oracle and legacy events while persisting workflow state in Cosmos DB. I applied integration-hardening patterns such as idempotency, strict validation, and deterministic error handling. I also used GenAI tools to support code refactoring, accelerate unit test creation, and improve review cycles, helping teams reduce integration defects while maintaining delivery velocity.

I have delivered similar operational-grade services in identity platforms at Equifax, including document expiry alert services and customer-facing barcode key-tag workflows. I implemented secure AWS integrations using S3 and Secrets Manager to keep credentials and configuration controlled. I treat production support as part of engineering, diagnosing incidents via ServiceNow and Jira, coordinating certificate renewals and infrastructure upgrades, and closing root causes through code fixes and regression coverage.

Earlier in my career, I delivered regulated insurance conversion workflows using XML- and SOAP-based EDW pushes with control-table validation, multithreaded processing, and UC4 scheduling automation. This background enables me to design backend services that behave predictably under batch load, integrate cleanly with downstream systems, and produce audit-friendly outputs. I work effectively in Agile environments and keep delivery disciplined through estimation, sprint execution, and clean handovers.

I bring strong expertise aligned with modern German enterprise and fintech engineering standards: Java (8–21), Spring Boot, RESTful microservices, Kafka-based event streaming, and containerized deployments with Docker and Kubernetes, supported by CI/CD pipelines using Jenkins and SonarQube. I contribute across the stack with Angular, React, TypeScript, and RxJS, and work confidently with enterprise databases including Oracle, MS SQL Server, PostgreSQL, MySQL, DB2, and MongoDB, as well as XML/XSD/XSLT integrations. I focus on clean architecture, testability, observability (Splunk, Kibana, Dynatrace), and measurable system reliability in regulated environments. I collaborate effectively with product and QA stakeholders and am prepared to relocate to Germany, contributing with English at C2 and German at B1 level (Learning).

Sincerely,

Raja R
