Dear Hiring Manager,

I am applying for Senior Data Engineer roles in Germany where cloud-native data platforms, analytics, and governance are central to business execution. I bring over ten years of experience building production-grade data systems across international, highly regulated environments, with a strong focus on AWS, Python, SQL, and Power BI.

In my current role at UNHCR, I design and own end-to-end cloud data platforms that support forecasting, operational reporting, and executive decision-making across multiple departments. I architect AWS pipelines using S3, Lambda, Glue, and Python to modernize complex datasets and legacy workflows. These systems reduced data retrieval time by 45 percent and improved decision velocity for more than 200 active users. I also deliver advanced Power BI dashboards and predictive models that directly support long-term planning and resource allocation.

Previously, I led national-scale ETL and analytics initiatives supporting emergency response and government operations. I automated ingestion, validation, and transformation pipelines using Python and SQL, cutting reporting delays by 40 percent while significantly improving data quality across partner organizations. I worked closely with stakeholders across sectors, aligning technical design with operational and compliance requirements, including GDPR-aligned data access controls.

What I bring to a Germany-based engineering team is execution focus. I translate business requirements into scalable data architectures. I build systems that are secure, auditable, and reliable in production. I work comfortably with cross-functional teams, operate in Agile environments, and take ownership from design through deployment and adoption.

I am based in Frankfurt and legally authorized to work in Germany. I am seeking roles where data engineering supports real operational outcomes, not isolated reporting. I would welcome the opportunity to contribute to a team building robust, cloud-first analytics platforms at scale.

Kind regards,

Charles Herbert Matovu
