Dear Hiring Manager,

I am applying for PCB Design Engineer / Lead PCB Layout Engineer roles in Germany where you need reliable, constraint-driven PCB layouts that meet SI and EMI/EMC expectations and release clean manufacturing packages. I bring 14+ years delivering PCB layout and release across automotive, semiconductor, and aerospace programs for global stakeholders in Europe, the USA, and India.

In recent roles, I owned end-to-end ECAD delivery from schematic review and library creation through placement, routing, and release outputs (Gerber/ODB++, BOM support, and fab/assembly drawings). I work in Cadence Allegro/OrCAD and Altium, and I maintain disciplined constraint management for impedance control, length matching, differential pairs, and return-path continuity. I routinely partner with hardware, mechanical, and test teams to align ECAD-MCAD integration, mechanical constraints, test access, and release readiness.

I also drive DFX outcomes that German teams expect for first-pass build success. I close supplier feedback cycles across DFM/DFA/DFT, validate CAM outputs, and improve manufacturing readiness through checklists, documentation rigor, and revision control. I use Teamcenter for PLM-controlled releases and Jira for change tracking and cross-functional action closure.

I can contribute immediately on high-speed and power electronics boards, including multi-layer designs up to 24 layers and power platforms in the 48V-650V range. I will bring a stable delivery cadence, strong review discipline, and vendor-ready release packages that reduce rework and keep hardware integration on schedule. I would welcome the opportunity to discuss how I can support your Germany-based programs.

Sincerely,

Poornesha H M
