Dear Hiring Manager,

I am writing to apply for a Computer Vision / Machine Learning Engineer role. With over four years of hands-on experience building and deploying deep learning models across surveillance camera analytics, industrial inspection, and headset-less AR/VR systems, I bring a strong balance of research-driven experimentation and production-focused execution.

In my current role at Mantra Softech, I work on designing and optimizing computer vision models for surveillance camera based monitoring and inspection systems, with a strong focus on accuracy, stability, and edge-device performance. My responsibilities include experimenting with state-of-the-art architectures, retraining and tuning models using well-curated datasets, and validating performance directly on edge hardware. These efforts have resulted in measurable reductions in error rates and improved runtime reliability in real-world deployments.

Previously at Viziverse AI, I contributed to research and deployment of perception models for headset-less AR/VR applications, including pose estimation and gesture recognition. I built end-to-end ML pipelines covering data capture, preprocessing, training, evaluation, and integration, and worked closely with cross-functional teams to integrate model outputs into Unity-based applications. At Visionify.ai, I delivered industrial computer vision solutions by managing the full ML lifecycle from client requirement analysis and data annotation to model training, testing, and deployment while improving annotation workflows and overall project efficiency.

Across my roles, I have worked extensively with PyTorch, TensorFlow, Keras, OpenCV, scikit-learn, YOLO, SVMs, and supporting tools such as Jupyter Notebook, Matplotlib, Roboflow, and Weights & Biases. I am Microsoft Certified in Azure AI Fundamentals (AI-900) and bring a strong foundation in experimentation, model optimization, and translating research ideas into robust, production-ready ML systems.

I am highly motivated to contribute to teams working on real-world computer vision problems where performance, efficiency, and reliability are critical. I would welcome the opportunity to discuss how my background and technical skills can support your organization's goals.

Sincerely,
Sarathi P R
