Dear Hiring Manager,

With over seven years of experience in semiconductor equipment, robotics, cement manufacturing and engineering education, I bring a strong systems mindset to installation and validation work for complex tools in lab and fab environments. My current focus lies in semiconductor inspection systems where tool availability and first-time-right installs matter as much as technical depth. Work with cross-functional teams in development, process, quality and manufacturing gives me a practical view of how engineering decisions affect throughput, stability and safety in production.

At HCL Technologies, I supported KLA inspection tools across about ten lab and customer sites and owned full system installation and configuration of operating systems, applications and internal diagnostics tools. I run integration and performance checks using logs, Ion Monitor, Wafer Identifier and CID Tool and push defects quickly to the right stakeholders. By applying structured root cause analysis and converting recurring issues into clear troubleshooting guides, I helped improve first-pass acceptance by around twenty percent and cut unplanned downtime and investigation time by double-digit percentages.

Earlier roles as a research analyst, technical writer and assistant professor strengthened my ability to explain complex topics, work with production data and support teams that depend on clear documentation. At Beroe, I analysed supply chain risk signals for a portfolio of roughly three hundred pharma companies and standardised templates that reduced cycle time for repeatable analysis by about twenty percent. In parallel, I built and delivered technical training content using the ADDIE model, which raised learner outcomes and reduced rework on released material, and I taught robotics and manufacturing technology to cohorts of around sixty students per semester.

I am keen to bring this mix of systems engineering, diagnostics and documentation to a semiconductor equipment or systems engineering role in Germany. English at C1 level and German at B1 level help me integrate into international teams and work closely with local engineers and operators. I would welcome the chance to discuss how I can support tool installation, stability and knowledge sharing for your engineering and manufacturing teams.

Sincerely,
Sabish Raja
