Dear Hiring Manager,

I am applying for **Senior Data Engineer** roles in Germany where you need reliable batch data pipelines, governed lakehouse datasets, and production-grade Spark execution. I bring **7+ years** building curated datasets for analytics and reporting across banking, life sciences, and aerospace, with hands-on delivery in **Spark/PySpark, SQL data modeling, HDFS/Hive, Parquet/Delta Lake, Databricks SQL Warehouse, and AWS analytics stacks (EMR, S3, Athena, Redshift)**.

At **IBM (Banking)**, I own risk analytics ETL on Spark, publishing consumption-ready datasets used for reporting and downstream models. I engineer PySpark transformations on **HDFS and Hive** and standardize schemas and partition strategies to keep data stable across refreshes. I also tune joins and caching to reduce runtime and lower batch failures, and I support migration work by adapting workloads to **AWS EMR** and exposing tables via **Athena** and **Redshift** for self-serve analysis by stakeholders. In parallel, I delivered the LOANS HRAM data pipeline on an on-prem Hadoop/HDFS stack, processing 20M+ customer records per day and enabling real-time policy code calculations for proactive risk management across loans and the Barclaycard portfolio.

Previously at **Cognizant**, I modernized enterprise analytics pipelines by translating legacy **SQL/Informatica** logic into maintainable transformations and **Databricks Delta** tables. I used **SQL Warehouse** patterns to speed up dashboard queries and partnered closely with business teams to validate definitions, reconcile outputs, and document table semantics so data consumers could trust the numbers. I also drove **CI/CD** for Databricks and cloud outputs, keeping releases predictable with versioning and rollback discipline.

I will bring a delivery style that fits German engineering expectations: clear ownership, documented data contracts, strong quality gates, and measurable stability improvements. I work comfortably in regulated environments, align requirements early, and keep datasets audit-ready through validation, reconciliation, and consistent publish processes. I would welcome the opportunity to discuss how I can help your team ship dependable pipelines and high-quality datasets that analytics and risk stakeholders can rely on.

Sincerely,

Keerthivasan Murugesan
