Dear Hiring Manager,

I am applying for OSP Fiber Engineer opportunities in Germany. I bring 12 years building FTTH and metro networks across India and Malaysia, with a record of delivering complex outside-plant projects end to end. My experience spans route surveys, HDD and trenching supervision, splicing and OTDR testing, RoW permits, acceptance packs, restoration playbooks, and audit-ready documentation. I focus on measurable outcomes, crew safety, and on-time launch.

At Reliance Industries in Bengaluru (Oct 2021–Jun 2025), I built 120–180 km of FTTH and metro fiber across multiple wards, supervising trenching and ducting and closing acceptance tests on schedule. I completed 1,200–1,800 splices and terminations, ran OTDR and power-meter tests, and lifted first-pass acceptance to 95%. I cut permit turnaround 25% by sequencing drawings, BoMs, and site photos for faster municipal review. I lowered restoration MTTR 20% by standardizing test points, splice logs, and fault-localization playbooks. I trained 6–10 junior engineers and technicians on safe splicing practices, OTDR trace interpretation, labeling, and handover documentation, which reduced rework by 20%.

Previously at Quess Corp (May 2016–Sep 2021), I delivered 150–220 km of OSP builds across FTTH and enterprise last-mile, coordinating multi-vendor crews and night works. I completed 900–1,300 splices and closures while keeping insertion loss within spec through disciplined tray management and verified test sheets. I resolved 50–70 network faults per year using structured OTDR isolation and route-km walkouts, and I sustained a 98% documentation completion rate with accurate maps, splice records, and ATP packs. In an earlier Quess role (Sep 2015–Mar 2016), I supported overhead fiber rollouts on priority routes, validated link budgets and material consumption, and improved acceptance timelines by 15% through tighter quality checks.

My background also includes hybrid HFC and fiber integration at Asian Broadcasting Network in Malaysia (May 2014–May 2015), where I engineered hybrid nodes, executed test and troubleshoot routines, and documented procedures to stabilize operations after launch. Across roles, I use OTDRs, fusion splicers, power meters, and acceptance test frameworks with rigor. I build simple but effective status and QA dashboards in Power BI, and I work comfortably in Excel and MS Project basics. I can read and mark up drawings and have practical exposure to GIS and AutoCAD for redlines and as-builts.

I hold an MBA in International Business from Alagappa University and a B.Tech in Biotechnology from Anna University. I completed an Advanced Certification in Data Analytics for Business (IITM & Intellipaat), which strengthened my approach to KPIs, permit SLA tracking, and quality dashboards for field operations. This mix of field engineering, documentation discipline, and data-driven reporting helps me deliver predictable schedules, cleaner handovers, and fewer defects.

Germany is accelerating fiber deployment, and I am ready to relocate and contribute to high-quality FTTx builds. I welcome the opportunity to discuss how my hands-on OSP experience, acceptance rigor, and operational metrics can support your programs.

Thank you for your time.

Sincerely,
Prabakaran Arunachalam
