Dear Hiring Manager,

With 14+ years of experience building production grade data products across the EU, USA, and APAC, I offer a strong record delivering measurable impact in Data Science and MLOps. My recent work spans LLM RAG, time series forecasting, NLP, and recommender systems on AWS with Python, SQL, scikit learn, and PySpark. I focus on outcomes that matter to the business, while keeping code quality, reliability, and security standards high for regulated environments.

At Tata Consultancy Services, I lead projects for Apple that improve engineer self service and infrastructure efficiency. I build LangChain and Milvus based retrieval augmented generation on Splunk logs that lifts answer precision by about 25 percent and reduces false capacity alarms by about 30 percent. I analyze autoscaling signals and define Karpenter policies that lower overprovisioned nodes by about 15 percent. These initiatives combine robust data engineering with pragmatic model design and observability to improve availability and cost.

Beyond Apple, I redesign data privacy and AI foundation modules for Datom and integrate RAG search into analytics UIs, which lowers integration defects by about 40 percent and raises analyst task speed by about 20 percent. For Happy Workforce, I deliver skill extraction and recommendations using NLP and PySpark and enable single sign-on that increases content engagement by about 25 percent and reduces priority incidents by about 30 percent. Earlier at UST

Global, I accelerated BI and OLAP reporting for NACO and QUBZ with Apache Kylin and Superset and improved dashboard load times by about 35 percent. For Equifax, I automated credit data checks across the UK, USA, and Canada and added Kibana and AppDynamics monitoring that saves roughly 20 hours per week and improves incident detection by about 40 percent. At Wipro, I migrated and profiled about 22 million records for Xoserve into the UK Link System and supported State Street and Holmes with enterprise ETL and big data pipelines that raise reliability and throughput.

I am excited to contribute this blend of product thinking, hands on engineering, and stakeholder engagement to a Germany based team. I bring end to end ownership from discovery to deployment, experience working with cross functional groups, and a readiness to relocate. I would welcome the opportunity to discuss how these capabilities can support your goals in data driven growth, reliability, and cost efficiency.

Sincerely,

Srujish Sreedharan
