📄 Opportunity Card (Chancenkarte) – Germany

Dear Hiring Manager,

I am applying for the Senior Software Engineer position(Angular). With over seven years of experience in full-stack development, including strong expertise in Angular, TypeScript, and backend technologies such as Node.js and .NET, I bring both technical leadership and hands-on engineering experience aligned with your requirements.

At Neudesic (an IBM Company), I led Angular-based frontend development for an enterprise-scale system supporting 5,000+ users. I worked closely with the Product Owner to translate business initiatives into scalable technical solutions and implemented a micro-frontend architecture with 20+ reusable modules. Through mentoring and structured code reviews, I strengthened engineering standards and reduced production defects.

Currently at Intel, I design and deliver secure full-stack solutions, building RESTful APIs and implementing RBAC-based authentication. I have experience working with .NET-based services and relational databases, as well as optimizing SQL queries for large-scale data processing. I also contribute to cloud-native deployments using Docker, Kubernetes, and Azure DevOps, ensuring reliable CI/CD pipelines and stable production releases.

I am comfortable working in Agile Scrum teams, designing maintainable architectures, and acting as a technical counterpart to Product Owners. I am motivated to contribute to a strong engineering culture focused on quality, scalability, and long-term maintainability.

I look forward to discussing how I can contribute to your team.

Sincerely,
Neethu Vinod
