Dear Hiring Manager,

I am a Senior Android Engineer with 10+ years of experience building Kotlin and Jetpack Compose applications for regulated domains. I design clean, modular MVVM architectures and ship predictable, testable releases supported by CI/CD, analytics-by-design, and accessibility compliance capabilities I am keen to bring to an EU-market product team in Germany.

At Eli Lilly, I own Android feature delivery across healthcare apps where reliability, privacy, and accessibility are non-negotiable. I standardized Compose components and CI gates in GitHub Actions, introduced a shared analytics SDK and event schema, and optimized startup/rendering paths through targeted profiling cutting ad-hoc analytics code by 60% and improving cold-start and jank metrics by 25% on key flows. Earlier at TCS, I led Android feature development end-to-end and drove quality improvements that reduced crashes/ANRs by 30% across active modules.

I thrive at the intersection of product, design, backend, and QA translating goals into stable, measurable outcomes. My toolkit spans Kotlin, Compose Navigation, Room, DI (Hilt), unit/UI/instrumentation testing, static analysis, release automation, and crash/analytics monitoring (Firebase/GA4). I'm comfortable with Agile/Scrum rituals, stakeholder communication, and design handoff (Figma). Beyond mobile, exposure to ReactJS, Node.js/Express, and Docker helps me collaborate effectively across the stack.

I bring EU-ready engineering habits accessibility by default, privacy-minded telemetry, documentation for auditability, and disciplined release processes. I hold B1 German (Intermediate Working Proficiency) and am fully open to relocation. I consent to the processing of my application data for recruitment purposes under applicable GDPR regulations.

Sincerely,
Ashutosh Srivastava
