Dear Hiring Manager,

Senior Automotive Software Test Engineer positions in Germany ask for deep ECU domain knowledge, strong diagnostics skills, and disciplined verification and validation. Over 7+ years, I have focused on airbag ECU software testing for global OEMs, combining requirements-based system and integration testing with CAN and UDS diagnostics, HIL campaigns, and targeted test automation.

At Continental Automotive Components India, I own verification and validation for airbag ECU software across multiple OEM programs. Day-to-day work includes designing requirements-based tests for CAN diagnostics, crash and deployment logic, warning functions, and event data recording using Vector CANoe and CANalyzer. I execute manual and automated regression on bench and HIL setups, flash ECU builds, analyse detailed CAN and internal signal logs, and raise clear, reproducible defects. By extending C, CAPL and Excel VBA utilities, I increased planned test coverage to around 90% per build and cut repetitive manual effort by roughly 20%.

Earlier at Veoneer India, I delivered V&V for airbag ECUs used by brands such as Hyundai, Kia, Mazda and VW Group. This included building and maintaining more than 300 requirements-based test cases for CAN diagnostics, event data recording, fault handling, deployment logic and sensor interfaces. I ran regression, smoke and confirmation testing across 5–8 builds per release, correlating CAN traces, internal signals and logs to isolate issues in safety-critical modules. Automation of data preparation and log review with Excel VBA reduced analysis effort by about 25% and helped shorten release cycles.

Beyond technical execution, I align closely with developers, component owners and project managers to keep testing transparent and predictable. Discussions often focus on risk, testability, and diagnostic coverage, which matches how German Tier-1s and OEMs structure their ASPICE-style development and release gates. My ISTQB certification reinforces this structured approach, and I bring a consistent habit of maintaining traceability from requirements to test cases and results.

Germany's emphasis on safety, reliability and robust diagnostic coverage in automotive electronics strongly matches my experience in airbag ECU projects. I would like to contribute that background to your ECU or safety systems team, particularly in roles focused on CAN and UDS diagnostics, HIL-based validation, regression strategy and test automation.

I would welcome the opportunity to discuss how this experience in airbag ECUs, CAN diagnostics and HIL testing can support your projects in Germany.

Sincerely,

Pavan Kulkarni
