Dear Hiring Manager,

With over five years of experience as a Backend Java Developer, I am interested in backend and microservices roles in Canada where robust, data-intensive platforms are a priority. My background spans Spring Boot microservices, REST API design, and database-driven services, and I consistently focus on reliability, performance, and clear communication with product, QA, and SRE teams.

In my current role at Tata Consultancy Services in Chicago, I design and build REST APIs using Spring Boot, Spring Data, and JPA/Hibernate to support internal and customer-facing applications. Recent work includes improving data accessibility by 30% for internal consumers, reducing release cycle times by 40% through Docker/Kubernetes and Jenkins-based CI/CD, and optimizing Oracle/SQL Server queries and JPA mappings to cut read latency on critical flows. These improvements came from close collaboration with architects, SRE, and QA to align SLAs, observability, and code quality with business expectations.

Beyond core backend delivery, previous experience as a Cloud Data Engineer at Cloud 9 Infosystems strengthened my understanding of analytics and reporting needs. I built finance datasets and Power BI dashboards that shortened reporting turnaround by 30%, standardized data workflows, and documented onboarding guides that reduced ramp-up time for analysts. This mix of backend engineering and data work helps me design APIs and services that are not only stable and secure, but also easy for downstream data and reporting teams to consume. I also hold a Master of Science in Computer Science from Roosevelt University and work comfortably in international teams using English at a professional level (C1).

Canada's strong engineering culture and focus on high-quality, long-lived software systems match how I like to work: measurable improvements, reliable releases, and transparent collaboration. I am ready to relocate to Canada, adapt quickly to local processes, and support any necessary relocation or work-authorization steps in line with company policy. I would welcome the opportunity to discuss how my experience with Java, Spring Boot, microservices, and CI/CD can support your backend roadmap.

Sincerely,

Siddharth Kapoor
