Dear Hiring Manager,

With more than 5 years as a PLM engineer focused on ENOVIA based engineering digitisation, rail and energy programmes have been the core of my work. Recent roles in global delivery for European clients built a solid mix of data migration, customisation, and production support on Dassault Systèmes platforms. This background aligns well with PLM engineer or PLM application support positions in Germany where stable product data and robust change processes are key.

In my current position at Accenture Technology, day to day responsibility covers L2 and L3 support for ENOVIA and CATIA in a rail engineering programme. I handle incident, problem, and change management, use SQL to diagnose issues in object structures and access rules, and coordinate with development and infrastructure teams so fixes pass defined release checks. The role also involves installation and validation of ENOVIA VPM servers, along with clear runbook documentation that helps keep ticket queues under control.

Earlier work in the EDF NNB Switch PLM and Bedrock Automation projects strengthened my data and automation skills. I delivered TCL, MQL, batch, and Java based utilities for PLM data migration from more than fifty legacy projects into ENOVIA and contributed JavaScript based loaders for Exalead CloudView. These projects demanded close attention to nuclear quality expectations, repeatable test steps, and cooperation with cross functional teams in Europe and India. This mix of scripting, migration, and search tooling helps new teams trust their PLM data and reduce manual correction effort.

Germany offers an environment where long term engineering programmes, safety standards, and structured processes matter. I bring experience with European clients, English at full professional proficiency, and German at intermediate level, plus a readiness to relocate and integrate into local teams. I would welcome the chance to discuss how this PLM background can support your product lifecycle, data migration, and application support goals.

Sincerely,

AMITH BHARGAV YERABATI
