Dear Hiring Manager,

I am applying for **Senior Middleware Engineer** (IBM WebSphere) roles in Germany. I bring 9+ years running IBM WebSphere ND and IBM HTTP Server estates for banking and telecom platforms, with hands-on ownership across production operations, HA design, performance tuning, and secure traffic controls on Linux and AIX.

In my current role at Coforge supporting a UK banking client, I own end-to-end WebSphere ND and IHS operations across test and production. I administer DMGR, node federation, clusters, plugin routing, virtual hosts, and JVM settings, and I drive incidents and change execution with disciplined runbooks and log-driven troubleshooting. I focus on service stability by tuning heap and thread pools, enforcing log policies, and validating failover behavior to keep customer-facing journeys available.

I also bring strong security execution for regulated environments. I manage SSL/TLS and mTLS (two-way SSL), certificate lifecycle, cipher alignment, and web-tier hardening to reduce outage risk and meet audit expectations. Additionally, I coordinate effectively across Network/Load Balancer teams (F5), OS teams, and application owners, and I escalate through IBM PMRs when required to restore service within operational SLAs.

Germany-based teams often expect clean change governance, production rigor, and repeatable operations. I work comfortably with RFC-driven delivery, patching/fix pack rollouts, monitoring via PMI and enterprise tools (Tivoli/ITCAM/APM), and release readiness checks for routing and connectivity. I would welcome the opportunity to bring this reliability-first operating style to your middleware platform and contribute to stable, secure, and compliant runtime services.

Sincerely,

Ashok Kumar Kavuru
