Dear Hiring Manager,

I am applying for Full Stack Engineer roles in Germany focused on Java/Spring Boot and React. I build web applications that ship cleanly and run reliably in production. I deliver REST APIs, authentication, and database-backed workflows, and I keep implementation simple, testable, and easy to maintain.

In my recent internship at ZIDIO Development, I built backend services using Java 17 and Spring Boot 3 with a clear layered structure and REST-first design. I implemented JWT-based authentication and role-based access control, and I designed MySQL schemas for core modules like users, jobs, applications, messaging, notifications, and subscriptions. I also built real-time features using WebSockets for messaging and alerts, and I supported analytics export with Apache POI. On the frontend, I delivered responsive React 19 UI with Tailwind and React Router, connected APIs through Axios, and ensured consistent validation and error handling across flows.

In my role at Vincible Soft (Spine Technology), I supported an enterprise HR and payroll platform used by 2,000+ employees. I resolved UI and functional issues tied to API integrations, stabilized core HR workflows, and supported release deployments. I improved usability through multilingual payslip support and reduced operational load by running HR user training and creating documentation that cut onboarding time by 25% and recurring support queries by 15%. This work trained me to debug quickly, communicate clearly with stakeholders, and ship changes without breaking business-critical systems.

I also deliver end-to-end products independently. I recently built a production-ready invoice generator with a React 19 + Vite frontend and a Node.js/Express backend connected to PostgreSQL. I implemented invoice, client, and item management with PDF generation, and I handled deployment and handover. This experience helps me contribute across the stack while keeping boundaries clear between UI, services, and data.

I am ready to contribute to German teams that value secure API design, SQL-first data modeling, maintainable backend services, and modern React execution. I work in English at C2 level and I'm improving German at B1. I'd welcome the chance to discuss how I can support your product delivery and backend reliability goals.

Sincerely,
Mariselvam A
