Dear Hiring Manager,

With more than 10 years in Identity and Access Management, I am keen to contribute to IAM Engineer roles in Germany where secure, compliant access is critical to business continuity. My work across IBM and Tata Consultancy Services covers the full IAM lifecycle for healthcare, retail, and insurance clients, with a focus on Single Sign On, federation, privileged access, and access governance.

At IBM, I design and support IBM Security Verify Access and Privileged Identity Manager for large enterprise environments. Daily work includes configuring junctions, access policies, and LDAP/DB2/TDI integrations across QA and production clusters, as well as maintaining high-availability setups for privileged access. These implementations improve SSO stability and privileged access uptime while reducing manual password resets and operational noise. Collaboration with security, infrastructure, and audit teams ensures that authentication flows remain stable and aligned with compliance expectations such as ISO 27001.

Earlier at TCS, I worked as an IAM Developer delivering ISIM, IGI, ISAM, and PIM solutions for retail and consumer-facing clients. Role mining using both top-down and bottom-up approaches helped define business and IT roles mapped to entitlements and Separation of Duties rules. This supported cleaner RBAC models, reduced access conflicts, and shortened provisioning cycles. I also contributed to migrations from TAM 6 to ISAM 7, configuring WebSEAL junctions, ACLs, and POPs and coordinating test cycles to ensure smooth cutover and audit-ready outcomes.

Germany's strong emphasis on data protection, regulatory compliance, and reliable infrastructure matches how I approach IAM work: controlled change, clear documentation, and measurable improvements in access hygiene. I am open to relocation, already work comfortably in international teams, and bring hands-on experience with IBM ISVA, ISIM, IGI, PIM, ESSO, Okta, and directory services such as Active Directory and LDAP. I would welcome the opportunity to discuss how this background can support your identity security roadmap and long-term platform stability.

Sincerely,

Esther Rani Christina S
