Dear Hiring Manager,

With more than 14 years in enterprise IT service delivery, my work has focused on keeping large, complex environments stable, measurable, and predictable. The role extends beyond managing tickets or teams and focuses on owning service outcomes across service desk, desktop, VIP support, and managed services, with consistent adherence to SLA commitments.

In my current role with Telstra, delivery accountability sits end to end. Major incidents, CAB governance, and problem reviews are handled with clear ownership, structured communication, and disciplined follow-through. I introduced DMAIC-based improvement cycles that reduced MTTR by 15% and removed recurring incident patterns by enforcing consistent PIR actions and knowledge updates. KPI and SLA packs clearly show service risks, recurring issues, and required follow-up actions.

Earlier at CGI, service delivery improved by tightening operational basics: clearer triage rules, stronger follow-up ownership, and escalation paths that actually resolved issues instead of circulating them. These changes lifted SLA compliance by 10% and stabilized delivery during new account transitions. Onboarding new clients involved defining baselines, governance rhythms, and communication models that could scale across vendors and geographically distributed teams.

The environments I work in require disciplined ITIL execution, audit-ready documentation, and service reviews driven by data. At the same time, delivery leadership requires judgment: knowing when to escalate, when to challenge assumptions, and when to simplify processes so teams can execute reliably.

I am interested in Germany-based roles where service delivery discipline, operational transparency, and continual improvement are valued as core strengths. I work professionally in English (C1), have working German proficiency (B1), and am prepared to relocate and contribute in structured, process-driven IT organizations.

Sincerely,

Neeraj Nema S
